

SOBE FIREWORKS

1. Fill Sobe bottle with gasoline to the neck as shown below. Don't spill. If you do, wipe it off and let it dry so outer surface is free of any flammable liquid.

2. Use Pocket Knife or Push Pin to make a hole in center of cap approximately 2 mm in diameter or smaller as seen below. Bigger is not better.

3. Don't put the cap on until you're ready to set it in the fire. The gasoline fumes will cause the inside rubber coating to melt and not seal tightly. **The bottle doesn't break or explode, rather the cap pops off.**
4. Set in an open spot in the fire. The base of the bottle should be set on a flat spot on the dirt or coals so it won't tip over. The fire should be such that flames are around it and above it (like a log hanging out over it). **Don't Rush. You have plenty of time.** It will take 1 to 2 minutes to start boiling and build up pressure. The pressure is released through the hole (which should catch fire in due time) and the cap bursts off allowing the gasoline to form a mushroom cloud like shown below. **Use Gloves.**
